

Siskiyou Pass

Siskiyou Pass, including the 4,310-foot-high Siskiyou Summit of I-5 that is located a short distance east of the original historic pass, is the highest and most historically significant mountain crossing on the main transportation route that links California and Oregon. The geographic feature known as Siskiyou Pass/Siskiyou Summit has earned an enduring legacy as both a physical and a psychological barrier between the two states. It receives by far the heaviest use of any pass in Oregon.

The original pass, situated about five miles north of the state line and less than a half-mile west of I-5's Siskiyou Summit, is at an elevation of 4,129 feet. After 1827, the year the first EuroAmericans explored the region, Siskiyou Pass came to be used successively by wagons, stagecoaches, railroads, and finally automobiles traveling the two-lane Pacific Highway.

The original pass crosses the divide between the Rogue and [Klamath](#) Rivers at a slight topographic notch formed by the geological contact between the older Siskiyou Mountains to the west and the younger volcanic Cascade Range to the east. Historically, the forbidding east-west-trending barrier that is surmounted by the pass came to be called Siskiyou Mountain and subsequently Siskiyou Mountains. These names, when applied to the mountains east of the pass, are now considered incorrect, but they still appear on some maps for what is actually part of Cascade Range.

Hudson's Bay Company (HBC) fur trader [Peter Ogden](#) and his group of trappers, who were traveling from south to north at the time, first crossed Siskiyou Pass in February 1827. Rising immediately west of the pass is a prominent rounded-top mountain, elevation 5,837 feet, now officially named Ogden Hill.

In 1829, Ogden's HBC colleague Alexander Roderick McLeod traveled south from Fort Vancouver through the Rogue River Valley and crossed the pass on his way to trap the streams of northern California. McLeod's disastrous retreat back across the pass during a blizzard contributed to Siskiyou Pass's reputation as a steep and difficult climb and a formidable winter crossing. Although the meaning of the name Siskiyou is uncertain, it is believed to be a Cree Indian word for bob-tailed horse. McLeod's HBC trappers, some of whom were Métis, applied the name after the bitter 1829 crossing, during which such a horse perished.

By the mid nineteenth century, the original HBC trail over the pass became first a wagon trail and then a stage road, followed by a railroad line. From the 1850s through the 1880s, the snowpack on the pass halted travel between the two states for months at time. From the 1890s through the 1910s, until powerful snowplows pushed by locomotives were used, passenger and freight traffic could be blockaded for weeks. As the highest point on [Interstate 5](#), snowstorms on Siskiyou Summit still pose a major challenge to winter travelers.

In addition to rugged topography and high elevation, violence also has contributed to the reputation of Siskiyou Pass as a daunting barrier. Dating from at least 1841, when an exploring party of the Wilkes Expedition crossed the pass, it became a place where EuroAmerican travelers remained especially alert against Indian attack. The last such skirmishes occurred in the early 1850s. Seven decades later, in October 1923, the three young Deaumont brothers, intent on robbing the mail car, climbed aboard the locomotive of a southbound Southern Pacific passenger train as it halted at the north portal of Tunnel #13 to check the brakes. During the so-called Last Great Train Robbery—which took place at about the same location as the 1850s episodes—the brothers shot to death three railroad employees and dynamited the mail car, killing the postal clerk inside. They escaped without securing any loot. Today's [interstate highway](#) passes within a few hundred feet of the spot, where the original Siskiyou Pass is visible directly above.

Originally, the combination of a steep grade and deep winter snowpack on Siskiyou Pass caused the Oregon & California Railroad to propose a California connection that would have avoided the pass altogether, by building south from Portland and, near Eugene, eastward over Willamette Pass into the gentler terrain of the upper Klamath Basin. With the Umpqua and Rogue valleys already heavily settled by the late 1860s, however, Oregon politicians ensured that the land-grant railroad would take the more difficult route. In 1887, completion of Tunnel #13 directly beneath Siskiyou Pass finally linked the two states by rail.

During the late 1950s, federal highway engineers made what was essentially the same detour proposal for [Interstate 5](#). Again, the political and economic influence of cities such as Medford and Roseburg won the day. The Southern Pacific Railroad, which had taken over the Oregon and California Railroad's Siskiyou Pass route in the late 1880s, completed

its Natron Cut-off over Willamette Pass in the 1920s. This faster, cheaper route, from Eugene and Klamath Falls to Weed, California, diverted rail traffic from the original route. By 2011, no trains had crossed Siskiyou Pass for nearly a decade.
